I Nitrogen Containing Functional Groups

Preparation and important reactions of nitro and compounds, nitriles and isonitriles Amines: Effect of substituent and solvent on basicity; Preparation and properties: Gabriel phthalimide synthesis, Carbylamine reaction, Mannich reaction, Hoffmann's exhaustive methylation, Hofmann-elimination reaction; Distinction between 1°, 2° and 3° amines with Hinsberg reagent and nitrous acid.

Coverage:

1. Amines: Preparation of Amines

Preparation of Amines—Direct Nucleophilic Substitution

Preparation of Amines—Direct Nucleophilic Substitution

- Although the process seems straightforward, polyalkylation of the nitrogen nucleophile limits its usefulness.
- Any amine formed by nucleophilic substitution still has a nonbonded electron pair, making it a nucleophile as well. It will react with remaining alkyl halide to form a more substituted amine, resulting in a mixture of 1°, 2°, and 3° amine products.
- Consequently, the reaction is most useful in preparing 1º amines by using a large excess of NH₃, and for preparing quaternary ammonium salts by alkylating any nitrogen nucleophile with one or more equivalents of alkyl halide.

Useful
$$S_{N2}$$
 $CH_{3}CH_{2}CH_{2}-Br+\ddot{N}H_{3}$ \longrightarrow $CH_{3}CH_{2}CH_{2}-\ddot{N}H_{2}+NH_{4}+Br-defined a constraint of the constraint of t$

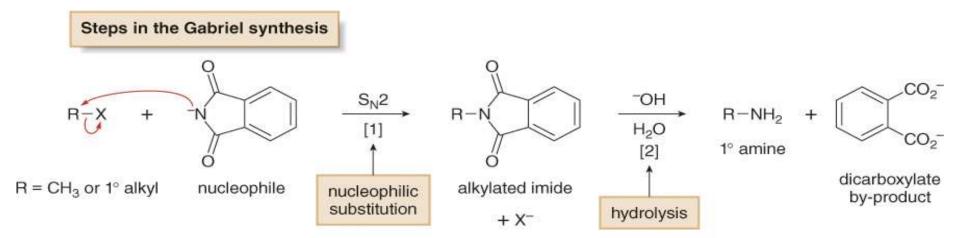

Preparation of Amines—Gabriel Synthesis of 1º Amines

- The Gabriel synthesis consists of two steps and uses a nucleophile derived from pthalimide to synthesize 10 amines via nucleophilic substitution.
- The N—H bond of a pthalimide is especially acidic because the resulting anion is resonance stabilized by the two flanking carbonyl groups.

 An acid-base reaction forms a nucleophilic anion that can react with an unhindered alkyl halide in an S_N2 reaction to form a substituted product.

Preparation of Amines—Gabriel Synthesis of 1º Amines

• The alkylated imide is then hydrolyzed with aqueous base to give a 1º amine and a dicarboxylate.

 The Gabriel synthesis converts an alkyl halide into a 1° amine by a two-step process: nucleophilic substitution followed by hydrolysis.

Preparation of Amines—Reduction of N-Containing Functional Groups

- Recall that amines can be prepared by reduction of nitro compounds, nitriles and amides.
 - [1] From nitro compounds (Section 18.14C)

Nitro groups are reduced to 1° amines using a variety of reducing agents.

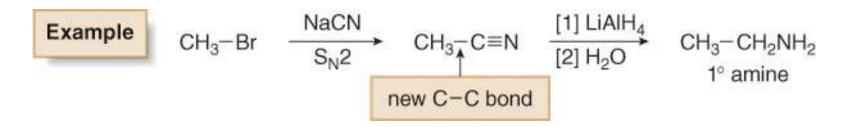

[2] From nitriles (Section 22.18B)

Nitriles are reduced to 1° amines with LiAlH₄.

$$R-C \equiv N \qquad \frac{[1] \text{ LiAlH}_4}{[2] \text{ H}_2\text{O}} \qquad R-C\text{H}_2\text{NH}_2}{1^\circ \text{ amine}}$$

Preparation of Amines—Reduction of N-Containing Functional Groups

Because the cyano group is readily introduced by S_N2 substitution of alkyl halides with ⁻CN, this provides a two-step method to convert an alkyl halide to a 1º amine with one more carbon atom.

Preparation of Amines—Reduction of N-Containing Functional Groups

[3] From amides (Section 20.7B)

1°, 2°, and 3° amides are reduced to 1°, 2°, and 3° amines, respectively, by using LiAlH₄.

Preparation of Amines—Reductive Amination

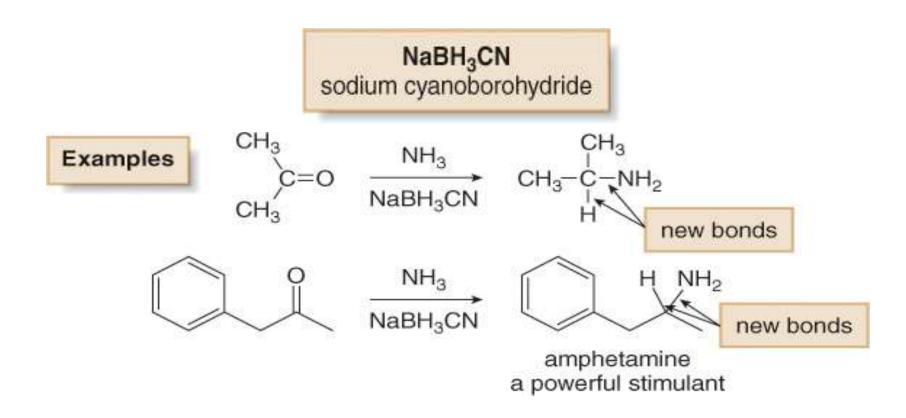

- Reductive amination is a two-step method that converts aldehydes and ketones into 1°, 2°, and 3° amines.
- Consider the reductive amination of an aldehyde or ketone using NH₃. There are two distinct parts to this reaction.
 - [1] Nucleophilic attack of NH₃ on the carbonyl group forms an imine.
 - [2] Reduction of the imine forms an amine.

Reductive amination— A two-step process R' = H or alkyl R' = H

◆ Reductive amination replaces a C=O by a C−H and C−N bond.

Preparation of Amines—Reductive Amination

 The most effective reducing agent for this reaction is sodium cyanoborohydride (NaBH₃CN).

Preparation of Amines—Reductive Amination

• With a 1° or 2° amine as starting material, reductive amination is used to prepare 2° and 3° amines respectively.

$$[1] \quad \stackrel{R}{\underset{\text{R'}}{\text{C=O}}} + \text{ $R'' \text{NH}_2$} \longrightarrow \left[\begin{array}{c} R \\ \text{C=NR''} \\ \text{R'} \end{array} \right] \quad \stackrel{\text{NaBH}_3\text{CN}}{\longrightarrow} \quad \begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & \text{H} \\ \text{2° amine} \end{array}$$

$$[2] \quad \stackrel{R}{\underset{\text{C=O}}{\text{C=O}}} + \text{ $R''_2 \text{NaBH}_3\text{CN}$} \longrightarrow \left[\begin{array}{c} R \\ \text{R'} - C - N - R'' \\ \text{R'} \end{array} \right] \quad \stackrel{\text{NaBH}_3\text{CN}}{\longrightarrow} \quad \begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

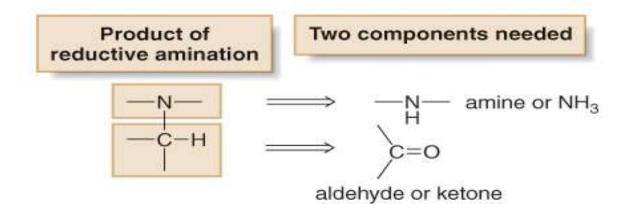

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

$$\begin{array}{c} R \\ R' - C - N - R'' \\ \text{H} & R'' \end{array}$$

Synthesis of methamphetamine by reductive amination

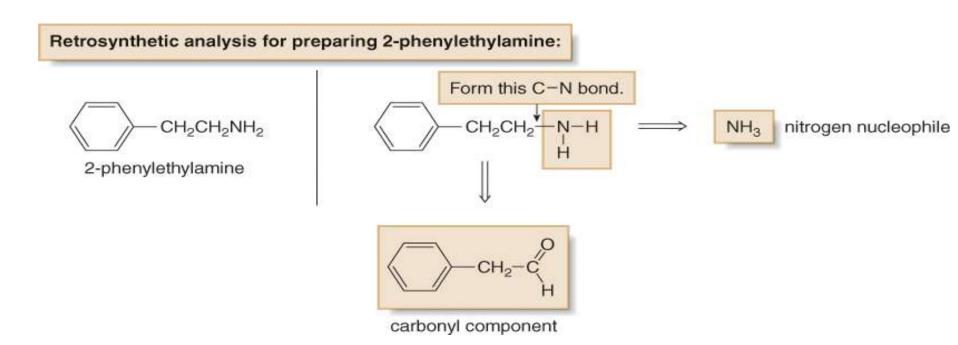

Preparation of Amines—Reductive Amination

- To use reductive amination in synthesis, you must be able to determine what aldehyde or ketone and nitrogen compound are needed to prepare a given amine that is, you must work backwards in the retrosynthetic direction. Keep in mind the following two points:
 - One alkyl group on N comes from the carbonyl compound.
 - The remainder of the molecule comes from NH₃ or an amine.

Preparation of Amines—Reductive Amination

For a 1º amine, the nitrogen component must be NH₃.
