# Join Operations:

A Join operation combines related tuples from different relations, if and only if a given join condition is satisfied. It is denoted by  $\bowtie$ .

# Example:

### EMPLOYEE

| EMP_CODE | EMP_NAME |
|----------|----------|
| 101      | Stephan  |
| 102      | Jack     |
| 103      | Harry    |

### SALARY

| EMP_CODE | SALARY |
|----------|--------|
| 101      | 50000  |
| 102      | 30000  |
| 103      | 25000  |

Operation: (EMPLOYEE ⋈ SALARY)

### **Result:**

| EMP_CODE | EMP_NAME | SALARY |
|----------|----------|--------|
|          |          |        |

| 101 | Stephan | 50000 |
|-----|---------|-------|
| 102 | Jack    | 30000 |
| 103 | Harry   | 25000 |

**Types of Join operations:** 

# **1. Natural Join:**

- A natural join is the set of tuples of all combinations in R and S that are equal on their common attribute names.
- o It is denoted by  $\bowtie$ .

**Example:** Let's use the above EMPLOYEE table and SALARY table:

### Input:

□EMP\_NAME, SALARY (EMPLOYEE ⋈ SALARY)

### **Output:**

| EMP_NAME | SALARY |
|----------|--------|
| Stephan  | 50000  |
| Jack     | 30000  |
| Harry    | 25000  |

# 2. Outer Join:

The outer join operation is an extension of the join operation. It is used to deal with missing information.

### Example:

### EMPLOYEE

| EMP_NAME | STREET      | СІТҮ      |
|----------|-------------|-----------|
| Ram      | Civil line  | Mumbai    |
| Shyam    | Park street | Kolkata   |
| Ravi     | M.G. Street | Delhi     |
| Hari     | Nehru nagar | Hyderabad |

# FACT\_WORKERS

| EMP_NAME | BRANCH  | SALARY |
|----------|---------|--------|
| Ram      | Infosys | 10000  |
| Shyam    | Wipro   | 20000  |
| Kuber    | HCL     | 30000  |
| Hari     | TCS     | 50000  |

## Input:

(EMPLOYEE ⋈ FACT\_WORKERS)

# Output:

| emp_na<br>Me | STREE<br>T         | CITY          | BRANC<br>H  | SALAR<br>Y |
|--------------|--------------------|---------------|-------------|------------|
| Ram          | Civil<br>line      | Mumbai        | Infos<br>ys | 100<br>00  |
| Shyam        | Park<br>stre<br>et | Kolkata       | Wipr<br>o   | 200<br>00  |
| Hari         | Neh<br>ru<br>nag   | Hyderab<br>ad | TCS         | 500<br>00  |

| ar |  |  |
|----|--|--|
|    |  |  |

An outer join is basically of three types:

- a. Left outer join
- b. Right outer join
- c. Full outer join

# a. Left outer join:

- Left outer join contains the set of tuples of all combinations in R and S that are equal on their common attribute names.
- o In the left outer join, tuples in R have no matching tuples in S.
- o It is denoted by  $\bowtie$ .

**Example:** Using the above EMPLOYEE table and FACT\_WORKERS table

#### Input:

#### 1. \_\_\_\_ EMPLOYEE ⋈ FACT\_WORKERS

| emp_na<br>Me | STREE<br>T         | CITY    | BRANC<br>H  | SALAR<br>Y |
|--------------|--------------------|---------|-------------|------------|
| Ram          | Civil<br>line      | Mumbai  | Infos<br>ys | 100<br>00  |
| Shyam        | Park<br>stre<br>et | Kolkata | Wipr<br>o   | 200<br>00  |
| Hari         | Neh<br>ru          | Hyderab | TCS         | 500        |

|      | stre<br>et         | ad    |      | 00       |
|------|--------------------|-------|------|----------|
| Ravi | M.G.<br>Stre<br>et | Delhi | NULL | NUL<br>L |

# b. Right outer join:

- Right outer join contains the set of tuples of all combinations in R and S that are equal on their common attribute names.
- o In right outer join, tuples in S have no matching tuples in R.
- o It is denoted by  $\bowtie$ .

**Example:** Using the above EMPLOYEE table and FACT\_WORKERS Relation

### Input:

EMPLOYEE ⋈ FACT\_WORKERS

### **Output:**

| emp_na<br>Me | BRANC<br>H  | SALAR<br>Y | STREE<br>T         | CITY    |
|--------------|-------------|------------|--------------------|---------|
| Ram          | Infos<br>ys | 100<br>00  | Civil<br>line      | Mumbai  |
| Shyam        | Wipr<br>o   | 200<br>00  | Park<br>stre<br>et | Kolkata |
| Hari         | TCS         | 500        | Neh                | Hyderab |

|       |     | 00        | ru<br>stre<br>et | ad   |
|-------|-----|-----------|------------------|------|
| Kuber | HCL | 300<br>00 | NUL<br>L         | NULL |

# c. Full outer join:

- Full outer join is like a left or right join except that it contains all rows from both tables.
- o In full outer join, tuples in R that have no matching tuples in S and tuples in S that have no matching tuples in R in their common attribute name.
- o It is denoted by  $\bowtie$ .

**Example:** Using the above EMPLOYEE table and FACT\_WORKERS table

#### Input:

#### EMPLOYEE 🔀 FACT\_WORKERS

#### **Output:**

| emp_na<br>Me | STREE<br>T         | CITY    | BRANC<br>H  | SALAR<br>Y |
|--------------|--------------------|---------|-------------|------------|
| Ram          | Civil<br>line      | Mumbai  | Infos<br>ys | 100<br>00  |
| Shyam        | Park<br>stre<br>et | Kolkata | Wipr<br>o   | 200<br>00  |

| Hari  | Neh<br>ru<br>stre<br>et | Hyderab<br>ad | TCS  | 500<br>00 |
|-------|-------------------------|---------------|------|-----------|
| Ravi  | M.G.<br>Stre<br>et      | Delhi         | NULL | NUL<br>L  |
| Kuber | NUL<br>L                | NULL          | HCL  | 300<br>00 |

# 3. Equi join:

It is also known as an inner join. It is the most common join. It is based on matched data as per the equality condition. The equi join uses the comparison operator(=).

### Example:

### **CUSTOMER RELATION**

| CLASS_ID | NAME    |
|----------|---------|
| 1        | John    |
| 2        | Harry   |
| 3        | Jackson |

### PRODUCT

| PRODUCT_ID | CITY   |
|------------|--------|
| 1          | Delhi  |
| 2          | Mumbai |
| 3          | Noida  |

# Input:

CUSTOMER 🖂 PRODUCT

# Output:

| CLASS_ID | NAME  | PRODUCT_ID | CITY   |
|----------|-------|------------|--------|
| 1        | John  | 1          | Delhi  |
| 2        | Harry | 2          | Mumbai |
| 3        | Harry | 3          | Noida  |
